SASUF Satellite Events 2024 – 14/05/2024

Materials and Methods

- Split-split-plot, RCBD, 3 replicates and 3 factors:

- 1) Spacing (1.0 m x 1.0 m (S1), 1.0 m x 1.5 m (S2))
- 2) Organic soil amendment (kraal manure (100 - 150 t/ha) (F1), compost (100 - 150 t/ha)) – 30:1 C:N ratio)
- 3) Soil & water conservation (conventional rainfed (farmers' practices) (R1), grass-mulched and water stress (R2), plastic-mulched and water stress (R3), grass-mulched and well-watered) (R4)

**10-year-old
Moringa trees**

Plastic-mulch →

Bare surface →

Grass-mulch →

Results and discussion

Table 1: Moringa leaf and biomass yield during the 2022 – 23 growing season.

Treats	1st Harvest	2nd Harvest	3 rd Harvest	4 th Harvest	Tot leaf yield	Total biomass

Conclusions and recommendations

- The season received sufficient rainfall and water supply was withheld on occasions
- In general, the crop water use of the two investigated plant spacings remained nearly the same
- Cultivating Moringa trees using narrower (1.0 m x 1.0 m) or wider (1.0 m x 1.5 m) tree spacing did not have a significant influence on the crop productivity (yield, water productivity, nutritional water productivity)
- The nutritional quality of Moringa is not affected by water regimes
- Moringa is drought-resistant and can retain its nutritional values
- Recommendations:
 - Narrower Moringa tree spacing is encouraged for better productivity
